CF Meetup: "Database Patterns for Unit Testing", with Bill Shelton

Thursday, July 17, 12:00pm

Meeting URL: http://experts.acrobat.com/cfmeetup/

Organized by Charlie Arehart

Description: Testing code that touches databases needs to be done, but it's hard. Databases can be large, complex, and the data can be changing frequently. To make matters worse, there are numerous vendor-specific database implementations that make it difficult to provide unified solutions to testing. In this talk, we will discuss some approaches to these challenges. We will show you how you can design your code so that you can isolate and test CF code that interacts with databases, we will show you how you can test database logic independently of your cf application, and we will discuss some Database Sandbox approaches developers can use to create a local test lab.
