CF Meetup: Leveraging RDS in Eclipse, Dreamweaver, and HomeSite+/CF Studio, with Charlie Arehart

Thursday, May 1, 2008 at 12:00 PM

Meeting URL: http://experts.acrobat.com/cfmeetup/

Organized by Charlie Arehart

Description: Are you using the RDS-enabled features in Eclipse, Dreamweaver, or HomeSite+? If not, you could be missing out on a lot of increased productivity, from the query building tools it enables, to the component browsing tools, to enabling file access across the web, and more.

Perhaps it's been disabled on your server, or people may argue that it's insecure. If you could be shown how it could be secured, might you (or your admin) reconsider it? I think it's a tragedy how many developers suffer without leveraging RDS, certainly on their own machines, and even on shared servers.

Whether you think RDS evil or a blessing, or are unaware of what it enables in your favorite CFML editor, and whether you use CF 8 or earlier, there may be more to RDS than you realize. And there are solutions to security concerns, especially in CF8 but even beforehand.

In this talk, frequent CFUG speaker Charlie Arehart will show you all the ways that RDS can be used to make you more productive in Eclipse, Dreamweaver, or HomeSite+. He'll also address (and in some cases resolve) common security

concerns, especially the multi-user RDS security available in CF 8 (and CF 4 and 5), as well as how to enable it if it's been disabled (assuming you have the right to make configuration changes, of course).
