Rapid Application Development with Model-Glue 2.0

Location: Bethesda North Marriott

In this class, we're going to write an online store in eight hours. We'll be using Model-Glue 2.0, also known as "Unity," a ground-up rewrite of the popular Model-Glue framework for ColdFusion. Model-Glue 2.0 is the first ColdFusion framework to provide scaffolding, the ability to automatically generate Object-Oriented, database-driven applications. In this class, we'll learn about the RAD capabilities this provides by using Model-Glue, in conjunction with the Reactor ORM framework, to create a functioning online store. We'll also learn a bit about agile development methodologies as well as the ColdSpring framework.
