CFML is one of the easiest languages with which to create and consume Web Services. Both BlueDragon and CFMX allow you to easily extend CFC methods to publish them as web services -- and it's just as easy to consume them as well. You don't need to understand XML to work with them. In this introduction to the topic, veteran CFUG speaker Charlie Arehart will show you how easy it is, explain what you need to know about CFCs, Web Services, and a little about XML. Other important issues like security and exception handling are covered as well.
