In this session, ColdFusion developers will learn how it's not CF or Flex, but rather how Flex and ColdFusion integrate to create RIAs. In "traditional" applications, CF connects to external systems, processes business logic, and builds an HTML presentation layer. In an RIA, CF still connects to external systems and processes business logic while Flex is used to construct a richer presentation layer delivered by the Flash Player. In this session, you'll see how the two technologies integrate and get a first taste of Flex development. You'll learn next steps for orienting yourself to Flex and common gotchas encountered by CF developers new to Flex. While previous experience with Flex is not necessary, knowledge of ColdFusion components will be helpful for this session.
