CFUnited Podcast: Jeff Tapper - Flex 2 for ColdFusion Developers

Hosted by Christian Ready

Description

Using Flex 2.0, you can now deploy Flex applications using any number of backend technologies without the addition of a Flex server product. However, with the new ColdFusion-Flex connectivity features, ColdFusion will have a significant advantage over all other backend technologies; providing the most efficient data exchange, the easiest programming model, and specialized tooling that make it the fastest, easiest way to build Flex apps with or without the purchase of a Flex server. This session will provide information on RemoteObject and the CF-Flex connectivity features including the use of value objects to exchange data between ColdFusion and Flex. Previous experience with CF/Flex applications is highly suggested
