Using Flex 2.0, you can now deploy Flex applications using any number of backend technologies without the addition of a Flex server product. However, with the new ColdFusion-Flex connectivity features, ColdFusion will have a significant advantage over all other backend technologies; providing the most efficient data exchange, the easiest programming model, and specialized tooling that make it the fastest, easiest way to build Flex apps with or without the purchase of a Flex server. This session will provide advanced details on RemoteObject and the CF-Flex connectivity features including the use of value objects to exchange data between ColdFusion and Flex. General tips and tricks related to data exchange between ColdFusion and Flex will also be discussed. Previous experience with CF/Flex applications is highly suggested.
