The future of Microsoft's Web Server Platform is exciting for developers! The release of Internet Information Services 7.0 in Windows Vista and Server will dramatically improve the development, deployment and management of web sites and applications. This demo packed session will highlight an all new, distributed configuration system and administration tool, a new modularized core web server with powerful new extensibility support. Most importantly, you will see how to plug in custom modules, written in native or managed code, in order to implement entirely new capabilities for IIS 7 and the web applications it delivers. Learn how these advances and more make IIS the best place to run ColdFusion applications.
